Cluster Version APIs

[ProductManifest \[config.alauda](#) [ClusterVersionShadow \[config.alauda.io/v1\]](#)

ProductManifest [config.alauda.io/v1]

Type

`object`

Specification

Property	Type	Description
<code>apiVersion</code>	<code>string</code>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources
<code>kind</code>	<code>string</code>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds

Property	Type	Description
<code>metadata</code>	<code>ObjectMeta</code>	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
<code>spec</code>	<code>object</code>	spec selects the product manifest source to resolve.
<code>status</code>	<code>object</code>	status reports resolved artifacts for the requested manifest source.

.spec

Description

spec selects the product manifest source to resolve.

Type

`object`

Property	Type	Description
<code>image</code>	<code>string</code>	image is a container image reference that contains the update payload.
<code>version</code>	<code>string</code>	version is the container image tag that identifies the update payload.

.status

Description

status reports resolved artifacts for the requested manifest source.

Type

object

Property	Type	Description
artifacts	array	artifacts reports channel-level artifact metadata and availability.
conditions	array	conditions reports reconciliation state for this ProductManifest.
observedGeneration	integer	observedGeneration of the object. When this matches the object's metadata.generation, it indicates the status is up-to-date.
resolvedImageDigest	string	resolvedImageDigest is the digest resolved from the desired release image.

.status.artifacts

Description

artifacts reports channel-level artifact metadata and availability.

Type

array

.status.artifacts[]

Description

Artifact describes one manifest component and its channels.

Type

object

Required

name

Property	Type	Description
channels	array	channels lists all channels reported by the manifest for this component.
name	string	name is the manifest component name.
packageType	string	packageType is the manifest package type.

.status.artifacts[].channels

Description

channels lists all channels reported by the manifest for this component.

Type

array

.status.artifacts[].channels[]

Description

ArtifactChannel describes one artifact channel from product.yaml.

Type

object

Required

`channel``repository``tag`

Property	Type	Description
<code>artifactStatus</code>	<code>string</code>	artifactStatus is the channel artifact probe result.
<code>brief</code>	<code>object</code>	brief is the localized short channel summary.
<code>catalogSource</code>	<code>string</code>	catalogSource is the OLM catalog source name.
<code>categories</code>	<code>array</code>	categories is the category set of this channel.
<code>channel</code>	<code>string</code>	channel is the channel name in product.yaml.
<code>default</code>	<code>boolean</code>	default indicates whether this channel is the default channel.
<code>description</code>	<code>object</code>	description is the localized channel description.

Property	Type	Description
<code>digest</code>	<code>string</code>	digest is the optional OCI digest of this channel package.
<code>displayName</code>	<code>object</code>	displayName is the localized channel display name.
<code>hidden</code>	<code>boolean</code>	hidden indicates this channel should be hidden from normal display.
<code>packIgnore</code>	<code>boolean</code>	packIgnore controls whether this channel is excluded by packaging workflows.
<code>provider</code>	<code>object</code>	provider is the localized provider name.
<code>providerType</code>	<code>string</code>	providerType is the provider classification.
<code>repository</code>	<code>string</code>	repository is the OCI repository of this channel package.
<code>supportedArchitectures</code>	<code>array</code>	supportedArchitectures is the architecture set this channel supports.

Property	Type	Description
<code>supportedPlatformVersions</code>	<code>array</code>	<code>supportedPlatformVersions</code> is the ACP platform version set this channel supports.
<code>supportedProtocolStacks</code>	<code>array</code>	<code>supportedProtocolStacks</code> is the protocol stack set this channel supports.
<code>tag</code>	<code>string</code>	<code>tag</code> is the OCI tag of this channel package.

`.status.artifacts[].channels[].brief`

Description

`brief` is the localized short channel summary.

Type

`object`

Property	Type	Description
<code>en</code>	<code>string</code>	<code>en</code> is the English variant.
<code>zh</code>	<code>string</code>	<code>zh</code> is the Simplified Chinese variant.

`.status.artifacts[].channels[].categories`

Description

`categories` is the category set of this channel.

Type

array

.status.artifacts[].channels[].categories[]**Type**

string

.status.artifacts[].channels[].description**Description**

description is the localized channel description.

Type

object

Property	Type	Description
en	string	en is the English variant.
zh	string	zh is the Simplified Chinese variant.

.status.artifacts[].channels[].displayName**Description**

displayName is the localized channel display name.

Type

object

Property	Type	Description
<code>en</code>	<code>string</code>	en is the English variant.
<code>zh</code>	<code>string</code>	zh is the Simplified Chinese variant.

`.status.artifacts[].channels[].provider`

Description

provider is the localized provider name.

Type

`object`

Property	Type	Description
<code>en</code>	<code>string</code>	en is the English variant.
<code>zh</code>	<code>string</code>	zh is the Simplified Chinese variant.

`.status.artifacts[].channels[].supportedArchitectures`

Description

supportedArchitectures is the architecture set this channel supports.

Type

`array`

`.status.artifacts[].channels[].supportedArchitectures[]`

Type`string`**.status.artifacts[].channels[].supportedPlatformVersions****Description**

supportedPlatformVersions is the ACP platform version set this channel supports.

Type`array`**.status.artifacts[].channels[].supportedPlatformVersions[]****Type**`string`**.status.artifacts[].channels[].supportedProtocolStacks****Description**

supportedProtocolStacks is the protocol stack set this channel supports.

Type`array`**.status.artifacts[].channels[].supportedProtocolStacks[]****Type**`string`**.status.conditions****Description**

conditions reports reconciliation state for this ProductManifest.

Type

array

.status.conditions[]

Description

Condition contains details for one aspect of the current state of this API Resource.

Type

object

Required

lastTransitionTime

message

reason

status

type

Property	Type	Description
lastTransitionTime	string	lastTransitionTime is the last time the condition transitioned from one status to another. This should be when the underlying condition changed. If that is not known, then using the time when the API field changed is acceptable.
message	string	message is a human readable message indicating details about the transition. This may be an empty string.
observedGeneration	integer	observedGeneration represents the .metadata.generation that the condition was set based upon. For instance, if .metadata.generation is currently 12, but the .status.conditions[x].observedGeneration is 9, the condition is out of date with respect to the current state of the instance.

Property	Type	Description
<code>reason</code>	<code>string</code>	reason contains a programmatic identifier indicating the reason for the condition's last transition. Producers of specific condition types may define expected values and meanings for this field, and whether the values are considered a guaranteed API. The value should be a CamelCase string. This field may not be empty.
<code>status</code>	<code>string</code>	status of the condition, one of True, False, Unknown.
<code>type</code>	<code>string</code>	type of condition in CamelCase or in foo.example.com/CamelCase.

API Endpoints

The following API endpoints are available:

- `/apis/config.alauda.io/v1/productmanifests`
 - `DELETE` : delete collection of ProductManifest
 - `GET` : list objects of kind ProductManifest
 - `POST` : create a new ProductManifest
- `/apis/config.alauda.io/v1/productmanifests/{name}`
 - `DELETE` : delete the specified ProductManifest
 - `GET` : read the specified ProductManifest
 - `PATCH` : partially update the specified ProductManifest

- **PUT** : replace the specified ProductManifest
- **/apis/config.alauda.io/v1/productmanifests/{name}/status**
 - **GET** : read status of the specified ProductManifest
 - **PATCH** : partially update status of the specified ProductManifest
 - **PUT** : replace status of the specified ProductManifest

/apis/config.alauda.io/v1/productmanifests

HTTP method

DELETE

Description

delete collection of ProductManifest

HTTP responses

HTTP code	Response body
200 - OK	Status schema
401 - Unauthorized	Empty

HTTP method

GET

Description

list objects of kind ProductManifest

HTTP responses

HTTP code	Response body
200 - OK	ProductManifestList schema
401 - Unauthorized	Empty

HTTP method

POST

Description

create a new ProductManifest

Query parameters

Parameter	Type	Description
<code>dryRun</code>	<code>string</code>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<code>fieldValidation</code>	<code>string</code>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

Body parameters

Parameter	Type	Description
<code>body</code>	<code>ProductManifest</code> schema	<code>application/json</code> formatted

HTTP responses

HTTP code	Response body
200 - OK	<code>ProductManifest</code> schema

ClusterVersionShadow [config.alauda.io/v1]

Type

`object`

Specification

Property	Type	Description
<code>apiVersion</code>	<code>string</code>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources ↗
<code>kind</code>	<code>string</code>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds ↗

Property	Type	Description
<code>metadata</code>	<code>ObjectMeta</code>	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
<code>spec</code>	<code>object</code>	spec is the desired state of the cluster upgrade.
<code>status</code>	<code>object</code>	status contains information about cluster upgrade.

`.spec`

Description

spec is the desired state of the cluster upgrade.

Type

`object`

Property	Type	Description
<code>desiredUpdate</code>	<code>object</code>	desiredUpdate is an optional field that indicates the desired value of the cluster version. Setting this value will trigger an upgrade (if the current version does not match the desired version).

`.spec.desiredUpdate`

Description

desiredUpdate is an optional field that indicates the desired value of the cluster version. Setting this value will trigger an upgrade (if the current version does not match the desired version).

Type

object

Property	Type	Description
		force allows an administrator to update to an image that has failed checks that are designed to keep the cluster safe.
force	boolean	Use only if: - testing - working around a known bug
image	string	image is a container image reference that contains the update.
version	string	version is the container image tag that identifies the update.

.status

Description

status contains information about cluster upgrade.

Type

object

Property	Type	Description
<code>availableUpdates</code>	<code>array</code>	<code>availableUpdates</code> contains available updates. This list may be
<code>conditions</code>	<code>array</code>	<code>conditions</code> provides information about the cluster version. The condition "Ready" is set to true if the <code>desiredUpdate</code> has been reached. The condition "Reconciling" is set to true if an update is being applied. The condition "Degraded" is set to true if an update is currently blocked by a temporary or permanent error. Conditions are only valid for the current <code>desiredUpdate</code> when <code>metadata.generation</code> is equal to <code>status.generation</code>.
<code>current</code>	<code>object</code>	<code>current</code> is the currently applied release version and image of the cluster.
<code>desired</code>	<code>object</code>	<code>desired</code> is the version that the cluster is reconciling towards. If the cluster is not yet fully initialized, <code>desired</code> will be set with the information available, which may be an image or a tag.
<code>history</code>	<code>array</code>	<code>history</code> contains a list of the most recent versions applied to the cluster. This value may be empty during cluster startup, and then will be updated when a new update is being applied. The newest update is first in the list and it is ordered by recency. Updates in the history have state

Property	Type	Description
		Completed if the rollout completed - if an update was failing or halfway applied the state will be Partial. Only a limited amount of update history is preserved.
<code>observedGeneration</code>	<code>integer</code>	observedGeneration of the object. When this matches the object's metadata.generation, it indicates the status is up-to-date.
<code>preflight</code>	<code>object</code>	preflight records information used during an in-progress upgrade to support deterministic preflight reentry behavior.
<code>stages</code>	<code>array</code>	stages expose the execution stages and per-operation DAG for the current update. Stages are executed sequentially; operations within a stage form a DAG.

.status.availableUpdates

Description

availableUpdates contains available updates. This list may be

Type

`array`

.status.availableUpdates[]

Description

Release represents an ACP release image and associated metadata.

Type

object

Property	Type	Description
image	string	image is a container image location that contains the update. When this field is part of spec, image is optional if version is specified.
version	string	version is a semantic version identifying the update version. When this field is part of spec, version is optional if image is specified.

.status.conditions

Description

conditions provides information about the cluster version. The condition "Ready" is set to true if the desiredUpdate has been reached. The condition "Reconciling" is set to true if an update is being applied. The condition "Degraded" is set to true if an update is currently blocked by a temporary or permanent error. Conditions are only valid for the current desiredUpdate when metadata.generation is equal to status.generation.

Type

array

.status.conditions[]

Description

Condition contains details for one aspect of the current state of this API Resource.

Type

object

Required

lastTransitionTime

message

reason

status

type

Property	Type	Description
lastTransitionTime	string	lastTransitionTime is the last time the condition transitioned from one status to another. This should be when the underlying condition changed. If that is not known, then using the time when the API field changed is acceptable.
message	string	message is a human readable message indicating details about the transition. This may be an empty string.
observedGeneration	integer	observedGeneration represents the .metadata.generation that the condition was set based upon. For instance, if .metadata.generation is currently 12, but the .status.conditions[x].observedGeneration is 9, the condition is out of date with respect to the current state of the instance.
reason	string	reason contains a programmatic identifier indicating the reason for the condition's last transition. Producers of specific condition types may define expected values and meanings for this field, and whether the values are considered a guaranteed API. The value should be a CamelCase string. This field may not be empty.

Property	Type	Description
<code>status</code>	<code>string</code>	status of the condition, one of True, False, Unknown.
<code>type</code>	<code>string</code>	type of condition in CamelCase or in foo.example.com/CamelCase.

`.status.current`

Description

current is the currently applied release version and image of the cluster.

Type

`object`

Property	Type	Description
<code>image</code>	<code>string</code>	image is a container image location that contains the update. When this field is part of spec, image is optional if version is specified.
<code>version</code>	<code>string</code>	version is a semantic version identifying the update version. When this field is part of spec, version is optional if image is specified.

`.status.desired`

Description

desired is the version that the cluster is reconciling towards. If the cluster is not yet fully initialized, desired will be set with the information available, which may be an image or a tag.

Type

object

Property	Type	Description
<code>image</code>	<code>string</code>	image is a container image location that contains the update. When this field is part of spec, image is optional if version is specified.
<code>version</code>	<code>string</code>	version is a semantic version identifying the update version. When this field is part of spec, version is optional if image is specified.

.status.history

Description

history contains a list of the most recent versions applied to the cluster. This value may be empty during cluster startup, and then will be updated when a new update is being applied. The newest update is first in the list and it is ordered by recency. Updates in the history have state Completed if the rollout completed - if an update was failing or halfway applied the state will be Partial. Only a limited amount of update history is preserved.

Type

array

.status.history[]

Description

UpdateHistory is a single attempted update to the cluster.

Type

object

Required

image

startedTime

state

Property	Type	Description
acceptedRisks	string	acceptedRisks records risks which were accepted to initiate the update.
completionTime	string	completionTime if set, is when the update was fully applied. The update that is currently being applied will have a null completion time. Completion time will always be set for entries that are not the current update (usually to the started time of the next update).
image	string	image is a container image location that contains the update. This value is always populated.
startedTime	string	startedTime is the time at which the update was started.
state	string	state reflects whether the update was fully applied. The Partial state indicates the update is not fully applied, while the Completed state indicates the update was successfully rolled out at least once (all parts of the update successfully applied).
version	string	version is a semantic version identifying the update version. If the requested image does not define a

Property	Type	Description
		version, or if a failure occurs retrieving the image, this value may be empty.

.status.preflight

Description

preflight records information used during an in-progress upgrade to support deterministic preflight reentry behavior.

Type

object

Property	Type	Description
checks	array	checks records the latest evaluation result for each preflight check.
observedAt	string	observedAt is the time when preflight was last evaluated.

.status.preflight.checks

Description

checks records the latest evaluation result for each preflight check.

Type

array

.status.preflight.checks[]

Description

PreflightCheckStatus records the latest result of a single preflight check.

Type

object

Required

name

Property	Type	Description
message	string	message contains human-readable details for the last result.
name	string	name is the preflight check name.
policy	string	policy indicates how the check behaves on reentry.
reason	string	reason is a programmatic identifier for the last result.
state	string	state is the latest result state for the check.

.status.stages

Description

stages expose the execution stages and per-operation DAG for the current update. Stages are executed sequentially; operations within a stage form a DAG.

Type

array

`.status.stages[]`

Type

`object`

Required

`name`

Property	Type	Description
<code>name</code>	<code>string</code>	name is the stage display name.
<code>operations</code>	<code>array</code>	operations are the DAG nodes in this stage.
<code>phase</code>	<code>string</code>	phase is the lifecycle status of this stage.
<code>priority</code>	<code>integer</code>	priority is the stage execution order (ascending).

`.status.stages[].operations`

Description

operations are the DAG nodes in this stage.

Type

`array`

`.status.stages[].operations[]`

Type

`object`

Required

`name`

Property	Type	Description
<code>action</code>	<code>string</code>	action is Install/Upgrade/Delete (omit for no-op/unknown).
<code>currentVersion</code>	<code>string</code>	currentVersion is the observed value at build/progress time.
<code>dependsOn</code>	<code>array</code>	dependsOn lists direct predecessor operation names within this stage.
<code>moduleInfo</code>	<code>string</code>	moduleInfo is the backing ModuleInfo name (if any).
<code>name</code>	<code>string</code>	name is the operation/component identifier (stable ID).
<code>phase</code>	<code>string</code>	phase is the current operation phase string (e.g. Running/UpgradePending/Failed).
<code>targetVersion</code>	<code>string</code>	targetVersion is the desired value at build/progress time.

`.status.stages[].operations[].dependsOn`

Description

dependsOn lists direct predecessor operation names within this stage.

Type

array

.status.stages[].operations[].dependsOn[]

Type

string

API Endpoints

The following API endpoints are available:

- `/apis/config.alauda.io/v1/namespaces/{namespace}/clusterversionshadows`
 - **DELETE** : delete collection of ClusterVersionShadow
 - **GET** : list objects of kind ClusterVersionShadow
 - **POST** : create a new ClusterVersionShadow
- `/apis/config.alauda.io/v1/namespaces/{namespace}/clusterversionshadows/{name}`
 - **DELETE** : delete the specified ClusterVersionShadow
 - **GET** : read the specified ClusterVersionShadow
 - **PATCH** : partially update the specified ClusterVersionShadow
 - **PUT** : replace the specified ClusterVersionShadow
- `/apis/config.alauda.io/v1/namespaces/{namespace}/clusterversionshadows/{name}/status`
 - **GET** : read status of the specified ClusterVersionShadow
 - **PATCH** : partially update status of the specified ClusterVersionShadow
 - **PUT** : replace status of the specified ClusterVersionShadow

Query parameters

Parameter	Type	Description
<code>dryRun</code>	<code>string</code>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

HTTP responses

HTTP code	Response body
200 - OK	<code>Status</code> schema
202 - Accepted	<code>Status</code> schema
401 - Unauthorized	Empty

HTTP method

`GET`

Description

read the specified ClusterVersionShadow

HTTP responses

HTTP code	Response body
200 - OK	<code>ClusterVersionShadow</code> schema
401 - Unauthorized	Empty

HTTP method

`PATCH`

Description

partially update the specified ClusterVersionShadow

Query parameters

Parameter	Type	Description
<code>dryRun</code>	<code>string</code>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<code>fieldValidation</code>	<code>string</code>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server

Parameter	Type	Description
		will contain all unknown and duplicate fields encountered.

HTTP responses

HTTP code	Response body
200 - OK	<code>ClusterVersionShadow</code> schema
401 - Unauthorized	Empty

HTTP method

PUT

Description

replace the specified ClusterVersionShadow
